

# Modis SST (day+night): January 2010

Note:

- negative anomalies in the N-GBR and Coral Sea region
- weak positive anomalies in the S\_GBR, with anomalies in the Capricorn Bunker group remaining positive
- strong positive anomalies in EAC region to the south of the GBR

# Northern GBR SST: January 2010

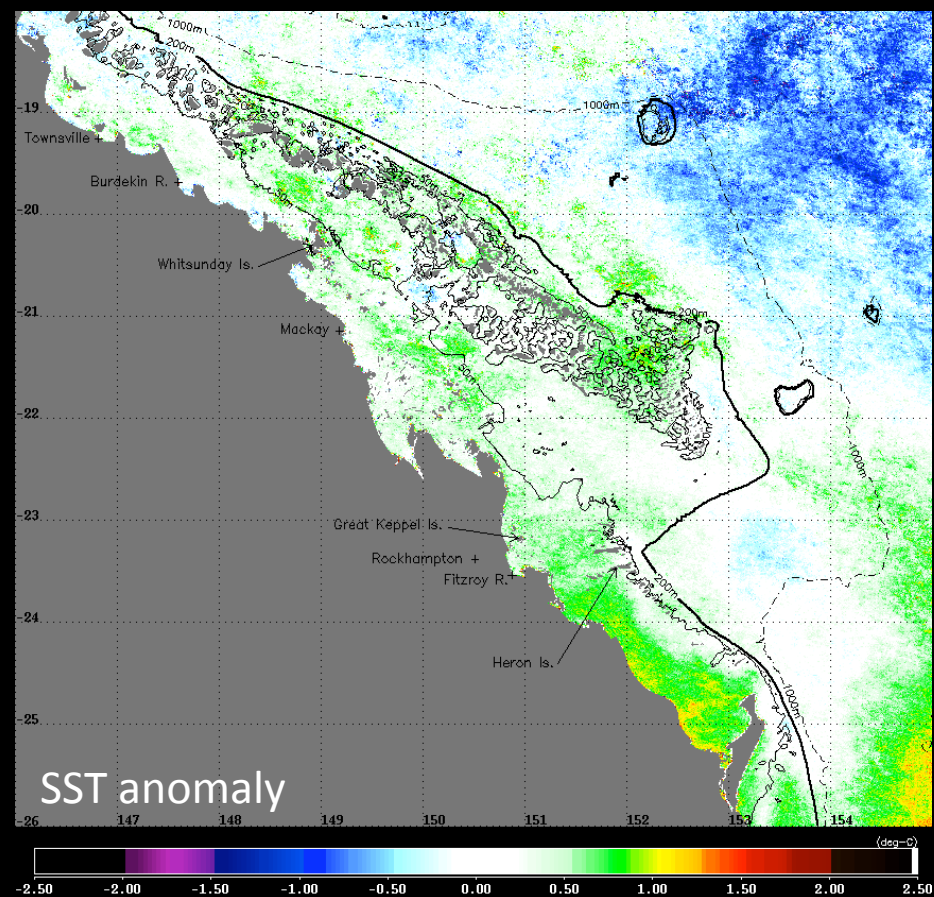

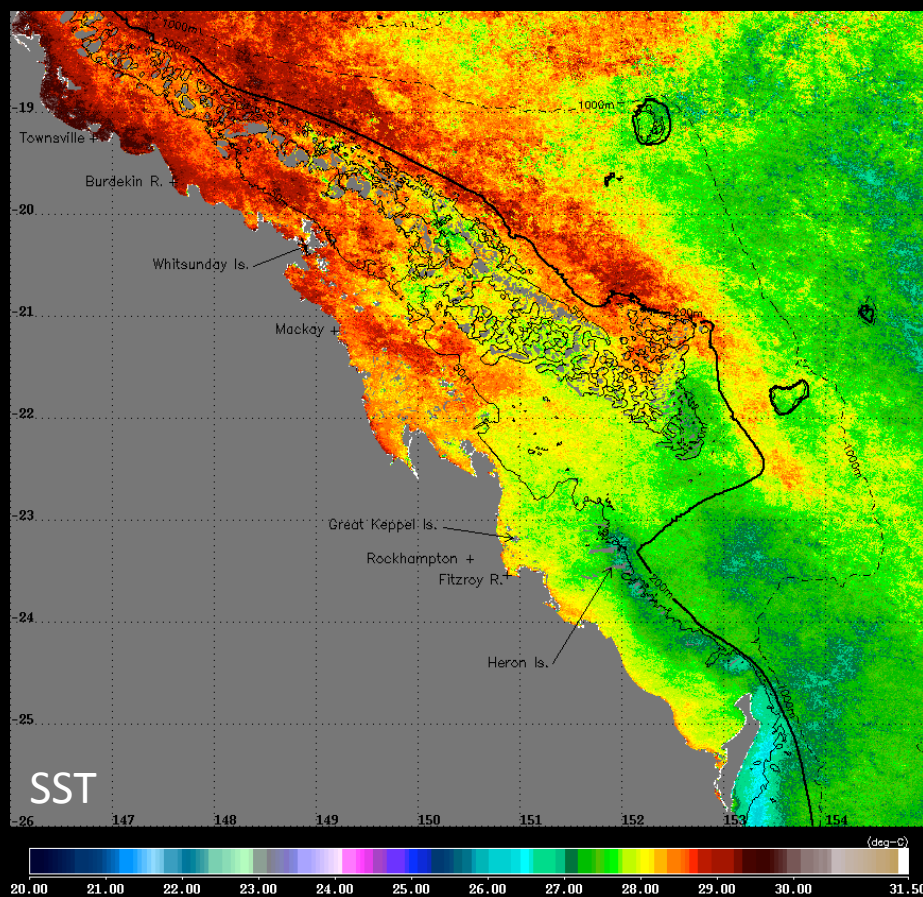

## Note:

- considerable cloud in Coral Sea region during January 2010
- negative anomalies in the N-GBR and Coral Sea region

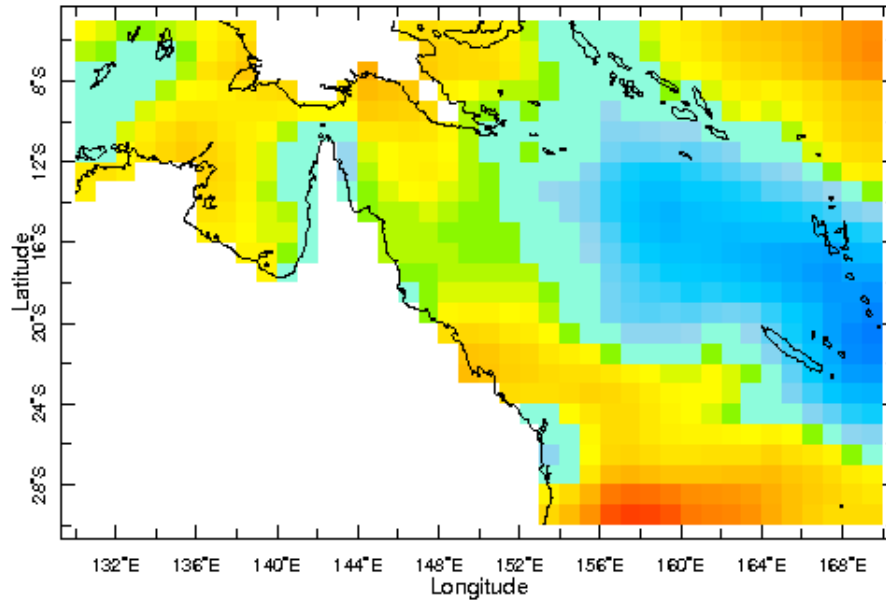

# Southern GBR SST: January 2010

## Note:

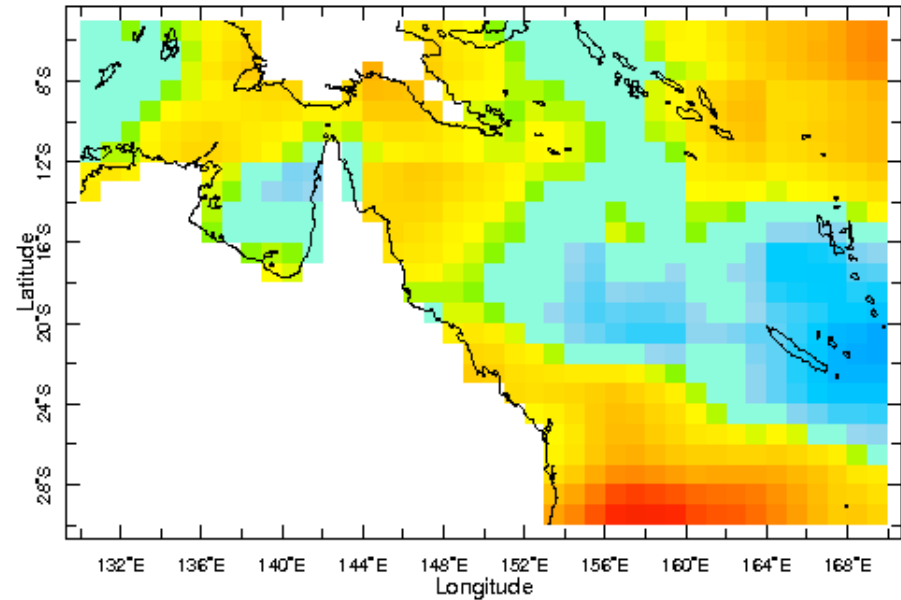

- weak positive anomalies in the S\_GBR, somewhat stronger on the shelf to the north of Fraser island
- anomalies in the Capricorn Bunker group remains positive

# NOAA NCEP EMC CMB GLOBAL Reyn\_SmithOlv2 weekly ssta: Sea Surface Temperature Anomaly data

3-9 Jan 2010

03 – 09 Jan 2010

16 Jan 2010

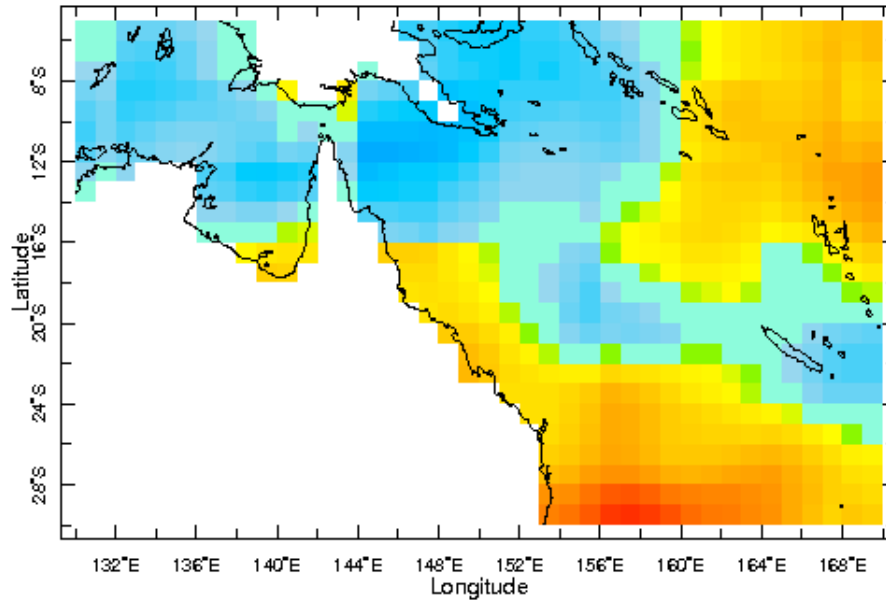

10 – 16 Jan 2010

## Note:

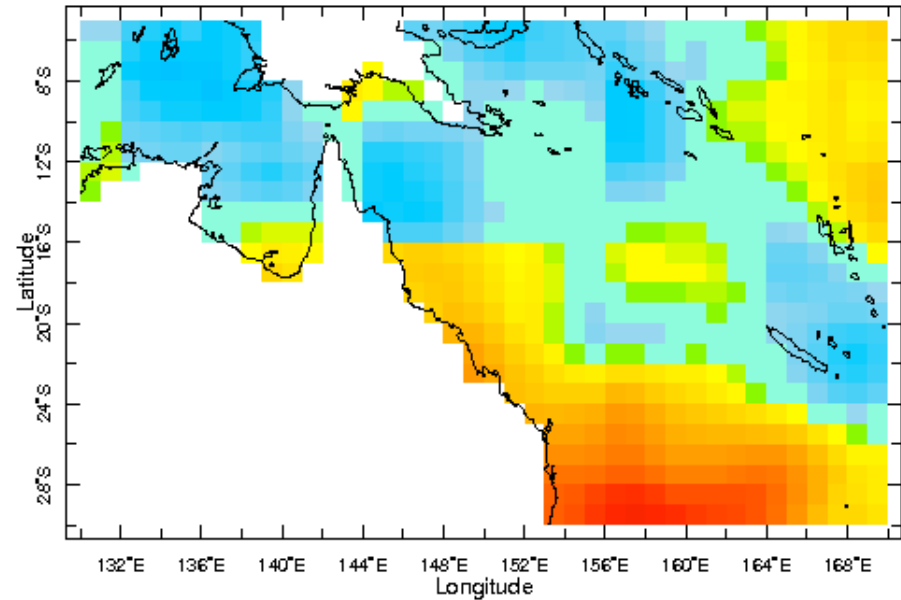

- In early January, NOAA Reynolds SST anomaly product shows a shift towards positive anomalies over the GBR.

# NOAA NCEP EMC CMB GLOBAL Reyn\_SmithOlv2 weekly ssta: Sea Surface Temperature Anomaly data

17-23 Jan 2010

17 – 23 Jan 2010

30 Jan 2010

24 – 30 Jan 2010

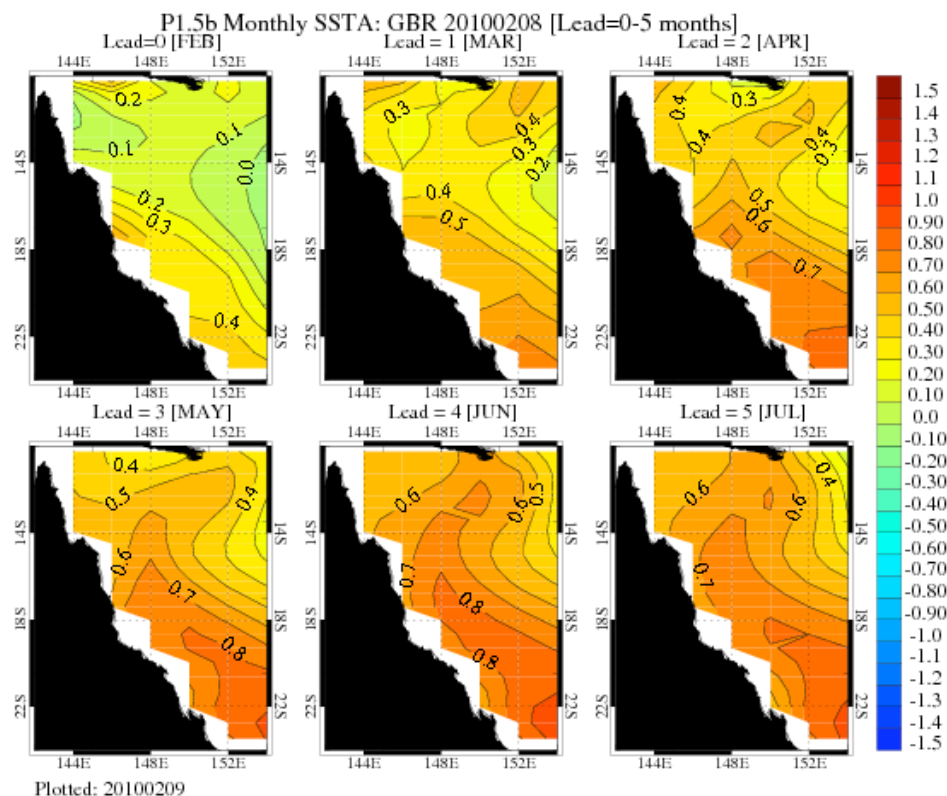

## Note:

- Coincident with MODIS monthly SST, NOAA Reynolds SST anomaly product shows negative anomalies on the N-GBR and positive anomalies for the S-GBR

# Experimental Great Barrier Reef SST Anomaly Forecasts (POAMA)

POAMA SST anomalies forecast for the following 6 months.

New POAMA product highlighting the probability of SST anomalies greater than 0.6 deg C for the following 6 months.

Note:

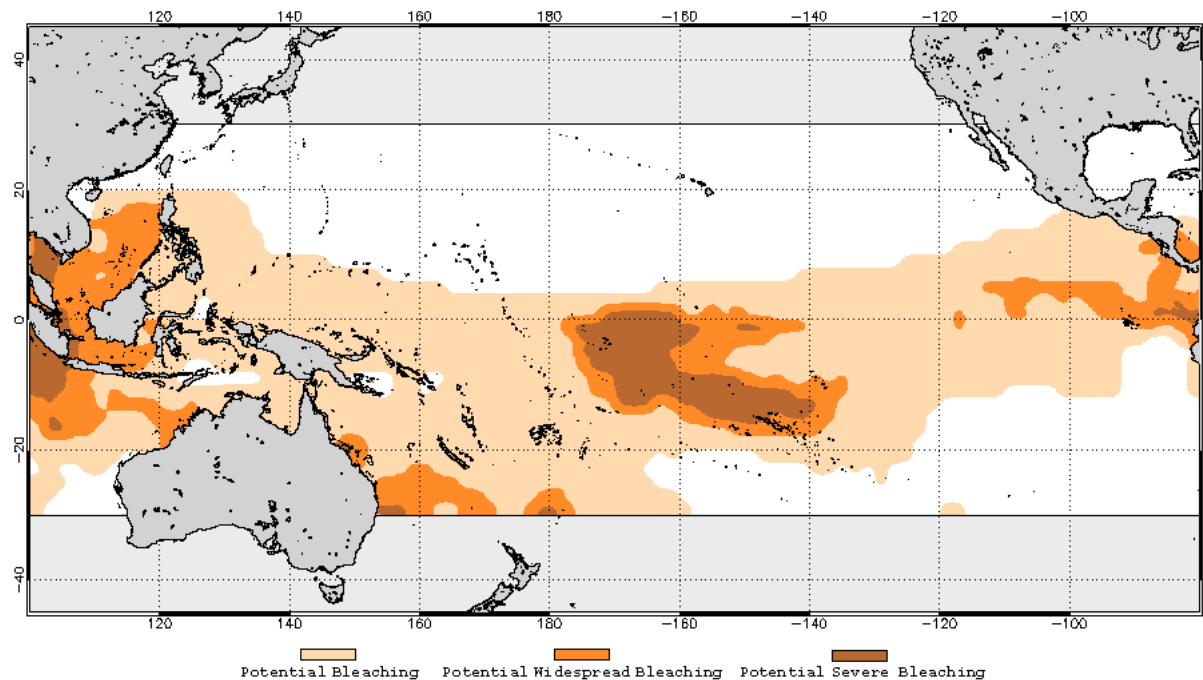

- POAMA predicts that anomalies will be greater than 0.6°C in the very southern GBR in March, a month earlier than the previous POAMA forecast. The positive anomalies are forecast through to July.

# NOAA Coral Reef Watch

## Seasonal Coral Bleaching Thermal Stress Outlook (Experimental product, 2x2 degree spatial resolution)

### Outlook for February to June 2010

2010 Feb 09 NOAA Coral Reef Watch Coral Bleaching Thermal Stress Outlook for Feb-May 2010

**Note:**

- the NOAA thermal stress Outlook for February to June has changed considerably since the last forecast
- this now predicts a potential widespread bleaching only in the S-GBR, coincident with the positive anomalies shown above

- The graphs in the lower panels show the number of days exposure to temperatures at or above those indicated on the x-axis and how they compare to bleaching thresholds. Bleaching thresholds are site-specific and are an interpolation of SST and exposure times between warmest non-bleaching summers and coolest bleaching summers. When the time-temperature curve exceeds the predicted bleaching threshold, sensitive corals are in danger of bleaching.
- The graphs in the upper panels show the trends of average daily temperatures against the long-term average. The number of years of data used in calculating the long-term average is shown in the legend.

## Note:

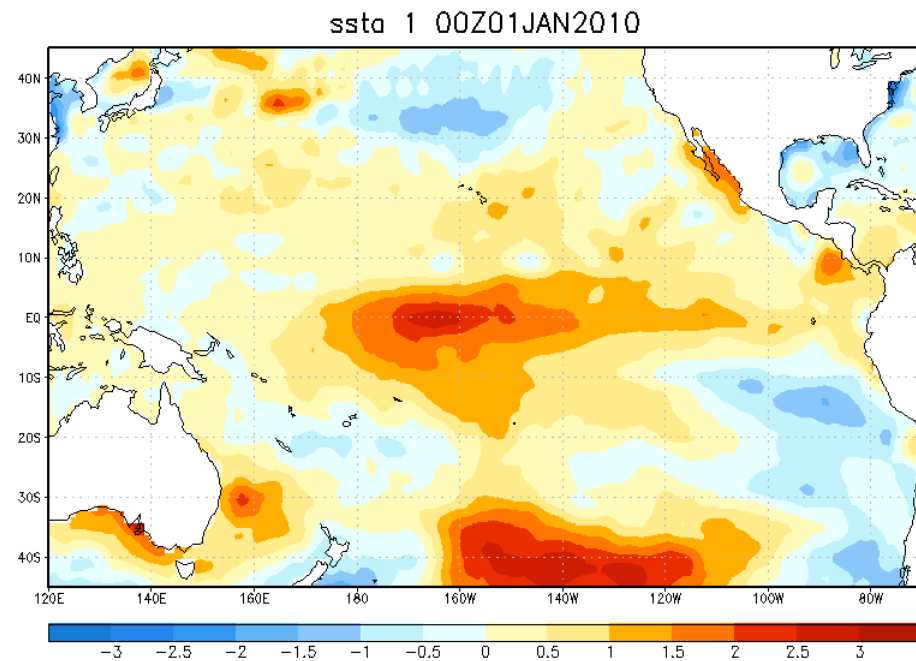

- The AIMS in-situ data also shows mostly close to average conditions for January.
- Towards the end of January, average daily temperatures do begin to exceed the long-term average in a few sites.

# NOAA Optimum Interpolation Sea Surface Temperature Analysis:

OI SST: JANUARY 2010

OI SST ANOMALY: JANUARY 2010

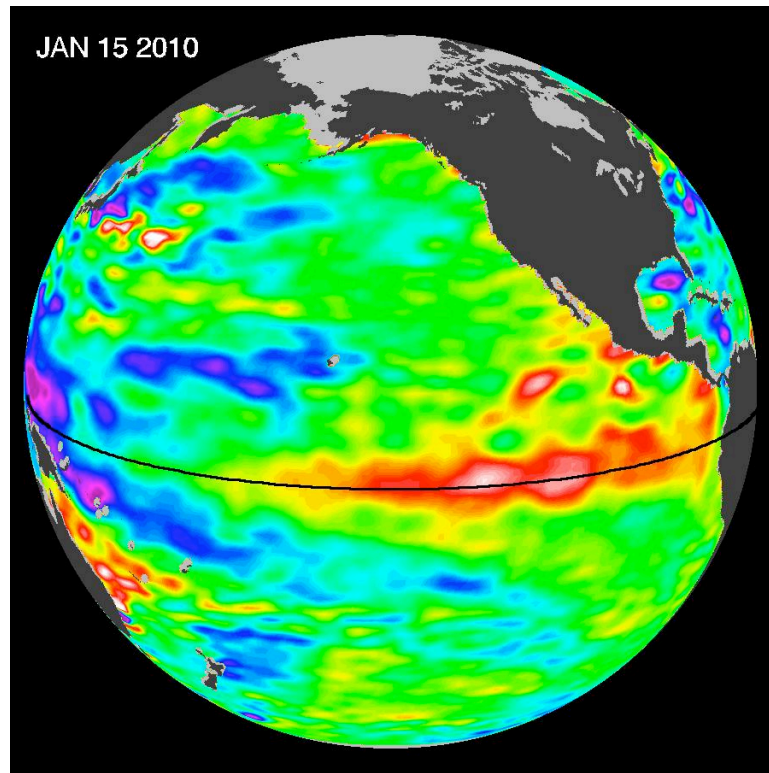

Note:

- The OI SST positive anomalies continues to be persistent in the Equatorial Pacific, still clearly indicative of an El Niño pattern.
- The positive anomalies in the EAC region have increased considerably, as per the Modis data.

# Sea surface height anomalies from Ocean Surface Topography: Jason-1 and Jason-2 (NASA/French)

10-day data cycle centered around January 2010.

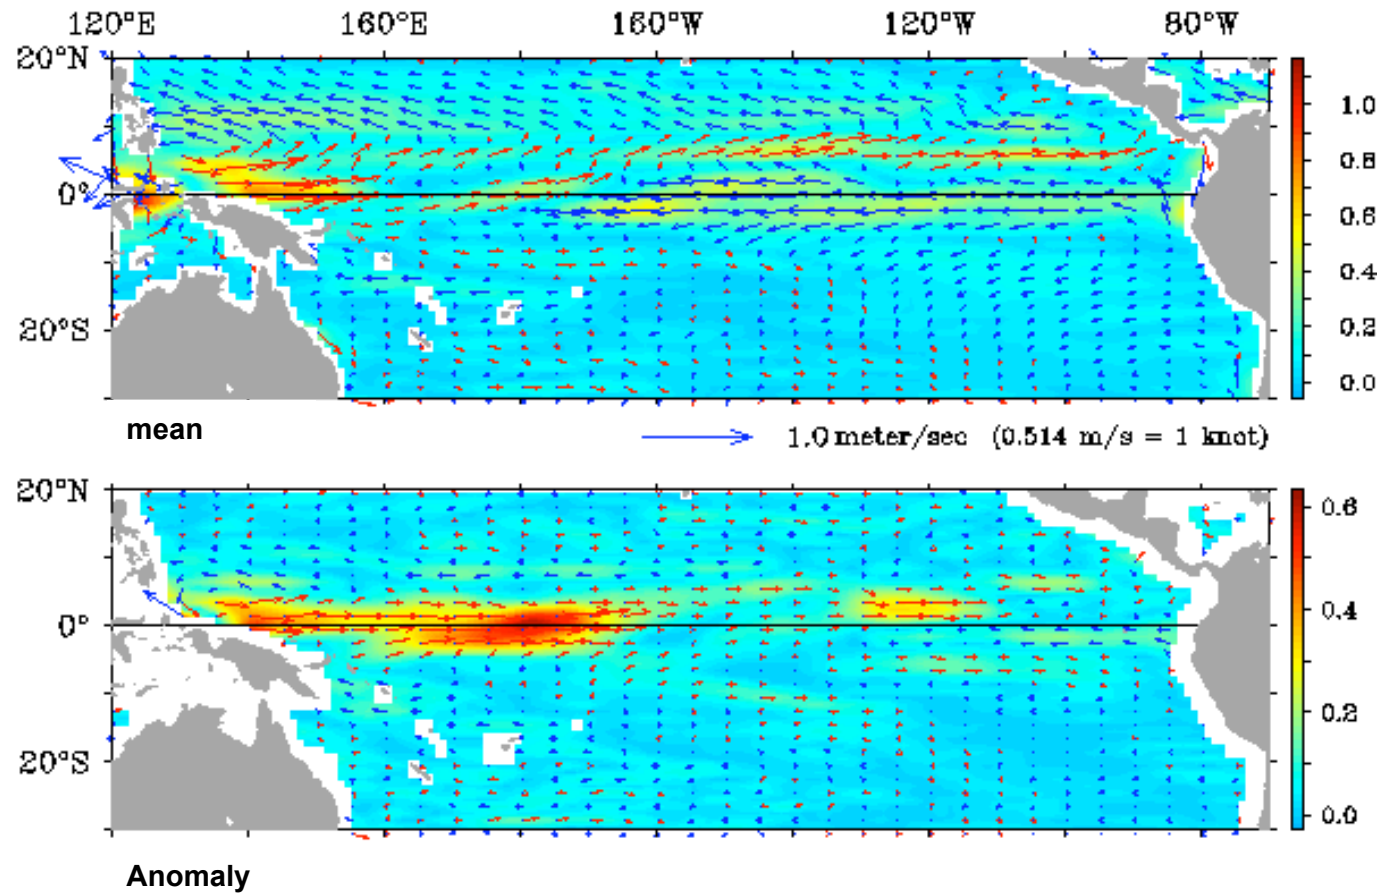

Note:

- The SSH anomalies continue to reflect an El Niño episode, associated with positive temperature anomalies across the eastern half of the equatorial Pacific

# OSCAR: Ocean Surface Current Analysis - Real time

January 2010: monthly mean vs anomaly

NESDIS/NOAA

Feb 10 2010

## Note:

- Although weaker than in December, the SEC continues to show positive eastward anomalies in equatorial Pacific, characteristic of an El Niño event.

# ENSO index

Negative SOI = El Niño

Positive Nino 3.4 index= El Niño

Note:

- Both indices still show an El Niño phase, although the Niño 3.4 index decreased in January.
- “Nearly half of the models indicate the 3-month Niño-3.4 SST anomaly will drop below  $+0.5^{\circ}\text{C}$  around April-May-June 2010, indicating a transition to ENSO-neutral conditions during Northern Hemisphere spring. However, predicting the timing of this transition is highly uncertain.” —excerpt from **ENSO Cycle: Recent Evolution, Current Status and Predictions Update prepared by Climate Prediction Center / NCEP 4 February 2010**
